

WARNING

Important Facts regarding **GLASS** and **PAINT**

Fact # 1

Glass tanks never need to be recoated on the inside or the outside. Saying "it CAN'T be recoated" is a misnomer because it will never "NEED" to be recoated.

Fact # 2

Epoxy painted tank coatings can be Rolled, Brushed, Baked (at the temperature of a loaf of bread), Sprayed, Robotically applied, electrostatically applied ... it doesn't matter. **Paint is Paint.** Cover it with liquid, cover it with powder, even cover it with plastic wrap....Paint **MUST** be recoated. Saying "it CAN be recoated" is deceiving because it will "HAVE" to be recoated. And the recoat will be field applied under field conditions by a local painting contractor, not the tank manufacturer, using the same paint as ANY painted tank and NOT some "miracle paint". ** Be sure to confirm that your tank has enough corrosion allowance so it actually can be repainted

Fact # 3

A name is just a name....and a name does not make a better product. A name does not even make a good product. A name is just something that someone decided to call something. Could be they liked the name, could be they wanted to confuse people, but in the end, a name is just a name.

FACTS ... with DECADES of history backing it up!!
